

(Pacfish/Infish Biological Opinion)

- Day 1: Biological Assessment, Crews of 4
- Day 2: Habitat Assessment, Crews of 4
- 80 hrs. labor/site
- 200 m.
- 1 site/2 days

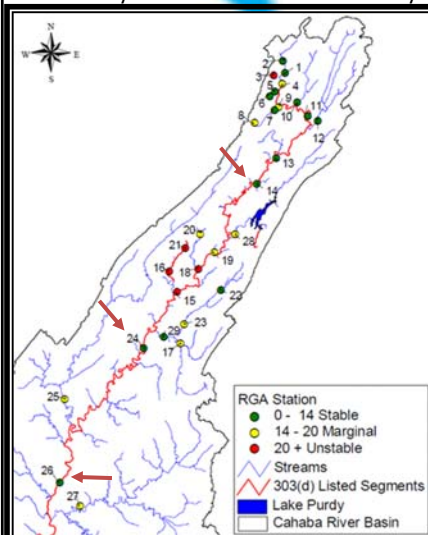

Problems with Traditional methods

- Limited access
- Time consuming
- Limited area/distance
- River size/depth limits
- How much do you sample?
 - Distance
 - Frequency?
- End product is a piece of paper and a dot on a map

Point vs Continuous Sampling

Cahaba River TMDL Sample Sites
100 km of river, 16 sample locations.
200m surveys = 3% of the river was surveyed.

Paint Rock River HDSS
61,382 continuous data points in 3 day, 53 mile field survey.
100% of the river was surveyed.

High Definition Stream Survey

1. Sides
 - River width
 - Bank protection
 - Bank condition
 - Bank angle
 - Bank height
2. Front
 - Habitat type
 - Canopy cover
3. Down
 - Depth
 - Substrate
 - Side-scan sonar
 - Hardness
4. As you pass
 - GPS track
 - Water quality

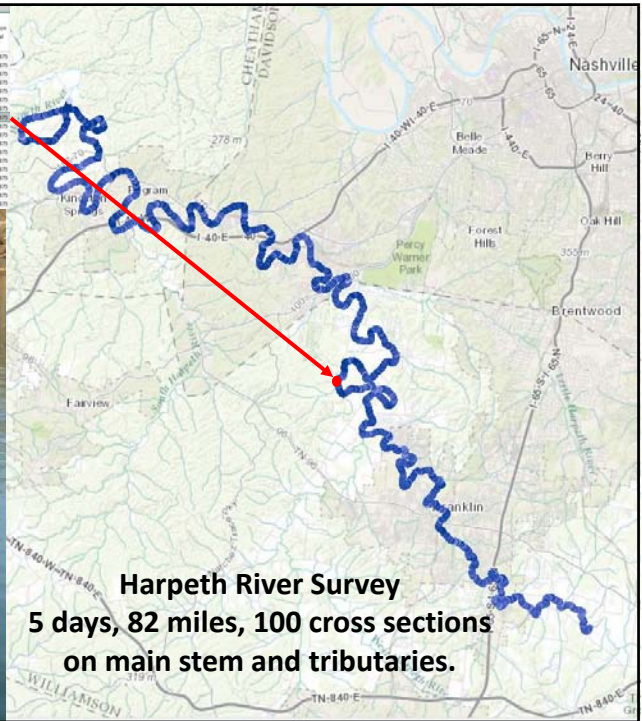

More than just Video.

Instant data output combined during post processing.

Contour Generation to Support Calculation of Exposed Snail Habitat in the Coosa River, Alabama

- Dams operated by Alabama Power
- Lay Lake standard summer pool ~120.6 m (395.6 ft AMSL)
- Six mile reach
- Reservoir drawdowns can expose threatened snail habitat
- Concerns for amount of habitat impacted

Bathymetric data collection

HEC-GeoRAS Project

HEC-GeoRAS ArcGIS add-in (USACE)

Create project for reach

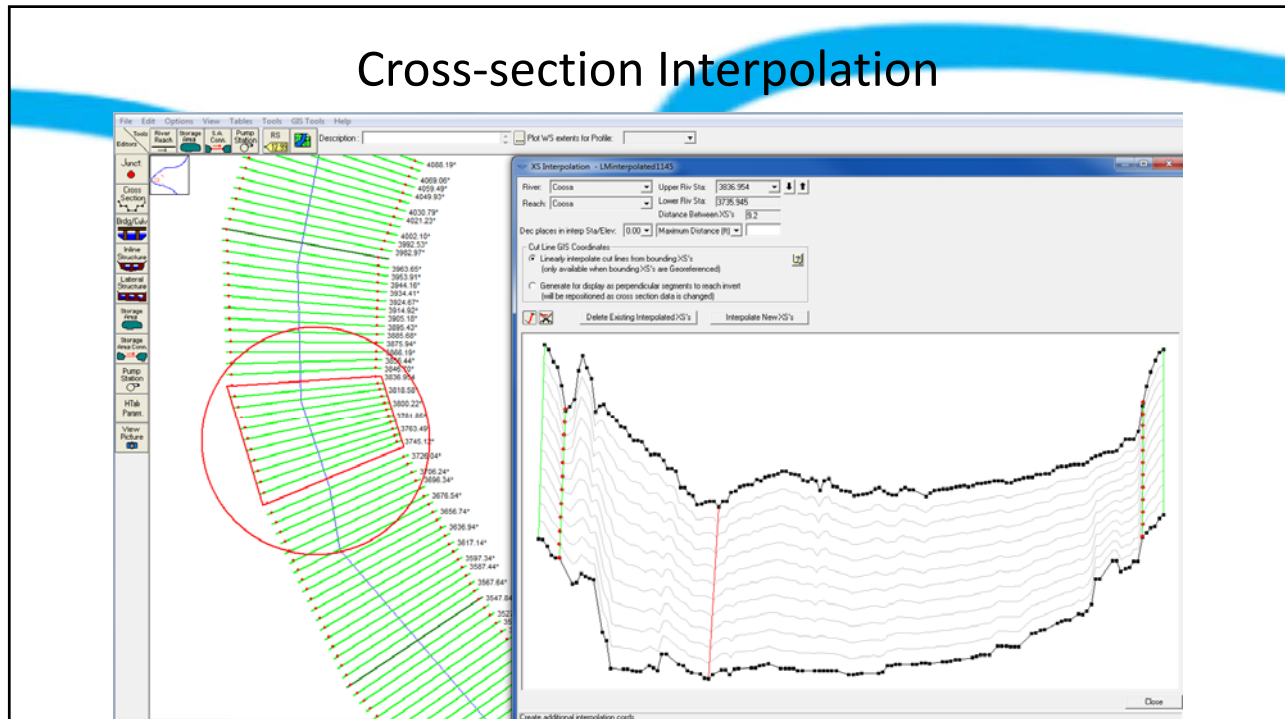

- Stream centerline (NHD)
- Banks
- Flowpaths
- Cross-section cutlines

Calculate 3D geometry

Export project

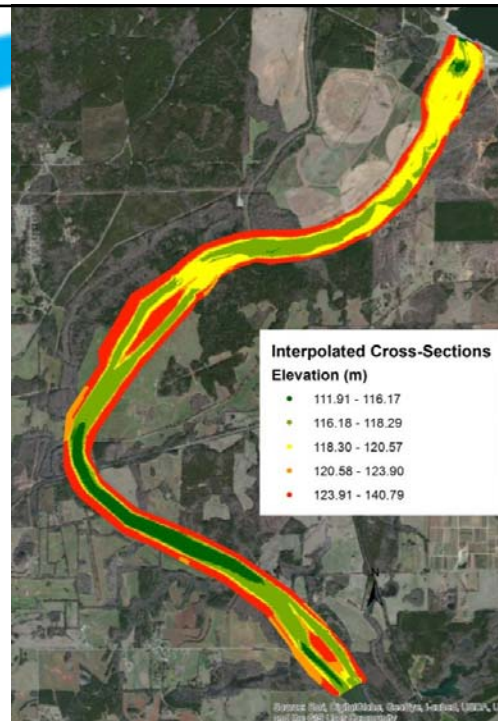

Cross-section Interpolation

- Export from HEC-RAS
- Interpolated Cross-sections imported into ArcGIS
- Successfully calculated habitat areas exposed
